3 Description of the dolphins:

Dolphin the etymology of dolphin takes us to the Latin word *delphin*, a term derived from the Greek. A dolphin is an aquatic mammalian animal that is part of the group of cetaceans.

• Dolphins are Piscivores:

They eat fish, there are more than thirty species of this animal that is usually about three meters long and has a single nasal opening.

It is important to mention that the members of the Delphinidae family live in salty waters, usually tropical or temperate.

The so-called river dolphins on the other hand, belong to the Platanistidae family group.
